

I would like to make a few comments in opposition to the current proposal and comments from Mattel.

First they are claiming that the 70cm band has been internationally accepted for the purposes we use the 900 mhz band. This is not true. It appears from their comments that their purpose is not to recieve additional frequecies they do not need if they engage in in good engineering.

Second they are claiming that the frequencies they are allowed to use will not allow for multiple vehicles to be used. I once was a salesman for Radio Shack. They are a major vendor of remote controled toys. In this capacity I learned much about these systems. The cheaper systems will in fact only allow one "car" per frequency. However Radio Shack also sales a digial controled system that works on the same frequencies with great success. Toys using this system can in fact operate at the same time. I once sold 7 units to a guy who has guests who race all of them at his home at the same time. It worked great.
